Ph.D/Post-Doc position in the Elia Lab for Cellular Imaging

We are seeking a Ph.D. student or Post-Doc to join our lab and engage actively in our ongoing project.

We are interested in revealing the mechanisms that lead to the separation of two cells after mitosis. As part of the subject, the role of microtubules and their interaction with the ESCRT (endosomal sorting complex required for transport) machinery responsible for membrane constriction and fission, should be investigated.

The project will combine molecular biological, biochemical and super-resolution microscopic methods. Therefore, expertise in one or more of these areas would be advantageous.

Highly motivated candidates should contact:
