

Biophysical Field Methods Workshop at Gobabeb: 27 May-12 June 2019

Day-by-day schedule

*Every day, Breakfast, Lunch and Dinner will be served at 07:00, 13:00 and 18:00, respectively. The lunch break will be until 15:00, after which we will gather in the lecture hall or library to work up data together and hold discussions. Evening activities will be held in the lecture hall or the library, depending on the subject, beginning at 19:00. Also, depending on the weather, some of the indoor activities might take place in the afternoon, when it is hot, rather than in the evening. There are several additional lecture possibilities; they will take place in the afternoons or evenings, depending on general progress.

<i>Date</i>	<i>Day</i>	<i>DoW</i>	<i>Activity</i>	<i>Notes</i>
27 May	1	Mon	Afternoon arrival at Walvis Bay International Airport; travel to Gobabeb in time for dinner.	Greetings and a short introduction to Gobabeb - Dr. Gillian Maggs-Kölling, director of Gobabeb. After that, we will introduce ourselves to each other.
28 May	2	Tue	<i>Morning:</i> general orientation and introduction to Gobabeb and the surrounding area where projects will be done; detailing connection to principles. <i>After lunch:</i> Division into groups and project choice. Project design with instructors; data sheet preparation and organization; assembling necessary equipment for fieldwork. <i>Late afternoon:</i> <i>Welwitschia</i> Wash and sundowners back at Gobabeb.	No lecture this evening, but a short Discussion Circle: Project development until we run out of steam around 22:00
29 May	3	Wed	Group 1-Project 1 Group 2 Project 2 Group 3 Project 3	Morning: Initial outing to research areas, marking research areas, identifying potential problems, completion of equipment. Afternoon - evening: Discussion Circle: Initial presentation of projects by each group of students (background, questions, hypotheses and predictions).
30 May	4	Thu	Group 1-Project 1 Group 2 Project 2 Group 3 Project 3	19:00 - 19:45. <i>Evening Lecture: Brief</i> introduction to geological and climatological history of the Namib Desert - Dr. Eugene Marais. Discussion Circle
31 May	5	Fri	Group 1-Project 1 Group 2 Project 2 Group 3 Project 3	16:45 - 18:00 <i>Late Afternoon Discussion</i> - outdoors: Philosophy of science in a nutshell, how to think like a scientist - Dr. Scott Turner After dinner - Project handover in discussion circle
1 June	6	Sat	Group 1-Project 2 Group 2 Project 3 Group 3 Project 1	19:00 - 19:45 <i>Evening Lectures:</i> How likely is dew to form on a desert soil and how can we quantify it? Dr. Nurit Agam
2 June	7	Sun	Group 1-Project 2 Group 2 Project 3 Group 3 Project 1	19:00 - 19:45 <i>Activity to be announced (TBA)</i> Discussion circle about the day's work

3 June	8	Mon	Group 1-Project 2 Group 2 Project 3 Group 3 Project 1	19:00 - 19:45 <i>Activity to be announced (TBA)</i> Discussion circle about the day's work
4 June	9	Tue	Day field trip to Mirabib and other sites or to Swakopmund (students can choose one or the other)	Gobabeb for supper
5 June	10	Wed	Group 1-Project 3 Group 2 Project 1 Group 3 Project 2	19:00 - 19:45 <i>Evening Lecture</i> : The extended organism 1: How termite mounds work - Dr. Scott Turner. Discussion circle
6 June	11	Thu	Group 1-Project 3 Group 2 Project 1 Group 3 Project 2	16:45 - 19:00. End of data collection sundowners on the rocks near Villa 3. <i>Evening Lecture</i> : Handling data and its presentation - Dr. Scott Turner. Open ended.
7 June	12	Fri	Group 1-Project 3 Group 2 Project 1 Group 3 Project 2	Research till noon. Lunch at 12:00. Depart at 13:30 for overnight field trip
8 June	13	Sat	Field trip - return for lunch at ~13:00	15:00 - 18:00 Work on data together
9 June	14	Sun	Work on data together	19:45 <i>Evening Discussion</i> : How to prepare your project report in the form of a scientific paper - Dr. Berry Pinshow
10 June	15	Mon	Work on data together	16:00 Group photo at gate.
11 June	16	Tues	Wrap up and Pack up; including cleanup of research areas	15:00 Mini conference - each group will make a short (20 minutes including questions) presentation of its data. Summation of the workshop - Dr. Scott Turner. Party after dinner
12 June	17	Wed	Depart for Walvis Bay and home	Bus leaves immediately after 06:30 breakfast!

Summer: Students will work together online to analyze and write up their results for publication.

Biophysical Field Methods 2019. Potential Projects

Projects:	Principles:	Project
!Nara wind and moisture capture (!N)	Wind and boundary layer Humidity, fog and dew point; turbulence	1
Black vs white desert beetles (B)	Operative temperature, radiation, convection, wind and boundary layer	2
Welwitschia Niche Construction (W)	Radiation heat balance Wind and boundary layer, soil moisture and temperature, water vapor cycling	3

!NARA

Source: <http://www.dw.com/en/over-1000-years-old-drought-resistant-and-unique-miracle-plants-in-the-namib-desert/a-39952494>

!Nara plants are well adapted to arid environments; they have spiky green stems and no leaves. Stomata are in furrows in the stems. !Nara plants grow on dunes and their many stems extend from small dunes that they "construct".

(https://en.wikipedia.org/wiki/Acanthosicyos_horridus).

Potential questions: Do the protruding stems reduce air turbulence and so cause sand to settle, and to eventually build the !nara's sand dune? Does more fog water thus accumulate than in the surrounding sand?

Hypothesis: The greater the stem coverage of the !nara dune, the higher will be the water content of the dune sand.

BEETLES

Source: <https://www.gettyimages.com/videos/tenebrionid-beetle?sort=mostpopular&offlinecontent=include&phrase=tenebrionid%20beetle>

Many desert beetles (Tenebrionidae) are black in colour and diurnally active; a phenomenon known as the "black beetle paradox".

Potential questions: From an energetic point of view, is being black advantageous over being a lighter color? Hypothesis: Since beetles are small and convection-coupled, being black allows them to dissipate enough absorbed radiation through the cooling effect of convection, allowing them to maintain optimal activity temperature for much of the day.

WELWITSCHIA

Source: <http://www.dw.com/en/over-1000-years-old-drought-resistant-and-unique-miracle-plants-in-the-namib-desert/a-39952494>

In contrast to !nara, Welwitschia is not a desert-adapted plant. Rather it has its origins in more mesic savannah. It has typical C-3 photosynthesis; its stomata are on both sides of the leaf and are not specially protected. However, the huge spread of the leaf creates a shaded environment all around the plant base.

Potential questions: Does the surface area of Welwitschia leaves cool sufficiently by radiative heat exchange at night to cause dew precipitation that might roll down the leaves to the protected soil surface below - and so serve as a water source for the plant? What does shading of the ground by the leaf do to the retention of soil water during the day?

Prediction: Surface temperatures of Welwitschia leaves rapidly drop below the dew point and remain so during clear nights, allowing dew to precipitate. Soils under Welwitschia leaves retain more water through the day than does unshaded, adjacent soil.
