· **Specific symptoms in biological assay:**
Epoxy resin CAS 28906-96-9:
This material was mutagenic in the Ames bacterial assay.
Mixture of triarylsulfonium/hexafluoroantimonate salts (CAS 71449-78-0 and 89452-37-9) in propylene carbonate (CAS 108-32-7):
This material was mutagenic in the Ames bacterial assay. It is inactive, however, in the in vivo mouse micronucleus test.
Propylene carbonate (CAS 108-32-7):
This substance had a negative Ames test with or without metabolic activation.
[3-(2,3-epoxypropoxy)propyl]trimethoxysilane (CAS 2530-83-8):
This material was weakly mutagenic in the Ames test, mouse lymphoma assay, and an in vitro sister chromatid exchange test; however results of in vivo genotoxicity studies have shown mixed results. Repeated exposure of rats or rabbits to this material did not result in an increase in sister chromatid exchange, while single exposures of mice to a hydrosylate of this materials resulted in a signficant increase in micronucleated polychromatic erythrocytes. The potential releavance to humans is unknown; however, it is ulikely that this material presents a significant genotoxic hazard, in that it lacks any local tumorigneic response the the chronic recurrent application to mouse skin.
