The Sylvan Adams Sports Center is a project that translates the green path activity of the university into reality. The interests of the university demonstrate how it promotes the efficient use of resources, energy saving, climate change adaptation, and biodiversity within its campus.

Simultaneously, the green path integrates a virtual map of the research laboratories of the university's developments in renewable energies, water, ecology, green building, urban planning, environmental health, agricultural innovation, and more.

The campus includes a biodiversity center, solar panels, a greenhouse, a meteorological station, and more.
